

## ORGANIC LIGHT EMITTING DIODES (OLED)

... the first really laminar source of light. In contrast to the point focused radiating, inorganic LEDs they use organic semiconductors for light generation.

The power flows via ultrafine organic layers – one hundred times thinner than a hair. As construction units they are very thin, presently only 2mm. The even, glare-free light with high colour reproduction quality of the OLEDs is very energy efficient, and environmentally compatible. They bring immediately the full lighting requirements, can be dimmed smoothly, and are very flexible regarding colour control. Materially, the OLEDs themselves can be very easily integrated into other materials, and can function very adjacently to sensitive materials without danger of burning. Flexible elements will also create in the near future completely new application types.

The network OLAB is a group formed from partners from economics and applied research backgrounds, affecting prototype development for niche markets, with the emphasis on image processing, security engineering, microscopy, medicine and automotive design. Along the formed value added chain in the medium term, the structure of one customized manufacturing of OLED lighting components will take place on the basis of the bare level parts.

**energy efficiency by organic light**

## CONTACT

### Network management

#### Technology Project Developement

Gotthard Weißflog, PhD

Hinter dem Spielberge 10

D-07751 Jena

Tel.: +49 (3641) 224889

Fax: +49 (3641) 224969

Mail: [info@oled-olab.net](mailto:info@oled-olab.net)
